

ASSIGNMENT [PYTHON]

DATE

LIST & TUPLE :-

VEJAY RAJESH. R
23BAI10917

① List :-

- * It is a built-in function in python and other programming languages.
- * It is used to store collection of data.
- * It is mutable as it can be modified, edited, operated and etc.
- * It consists of various types of list such as ordered list, unordered list.
- * List represented inside square brackets `[]`.

→ Eg: We use list in operations where we perform sum of items in a list, Multiplication of items in a list, etc. Refer the below example.

```
list_1 = [1, 2, 3, 4, 5]
list_2 = [6, 7, 8, 9]
add_list = [list_1] + [list_2]
print(add_list)
```

Output:

1, 2, 3, 4, 5, 6, 7, 8, 9

② Tuple :-

- * Tuple is a built in function in python and other programming languages.
- * It is similar to list which stores group of or collection of data.
- * It is immutable meaning that it can't be modified or edited directly as per the user is wishing.

DATE

--	--	--	--	--	--	--	--

* Like lists, tuples also have types like in name of methods such as ordered, Tuple length, Tuple items, Datatypes, etc.

* Tuples represented inside curly braces {}.

Eg: We have various examples for Tuple such as Tuple with one element, Tuple unpacking, Tuple concatenation, and Tuple as dictionary keys.

creating a tuple

```
my_tuple = (1, 2, 'cat is my pet', 'dog')  
print(my_tuple[2])
```

Output

cat is my pet
